Marquis Medical wins with Three-Phase Power Monitor

Knowing that power failed saved the company about $70K

Medical equipment is essential, with its health often meaning the difference between a successful diagnosis and asset malfunction. Louisiana-based Marquis Medical is a servicer of GE and Siemens healthcare systems. Its team repairs, maintains, and orders parts for these machines across the U.S.

Recently, Marquis Medical needed to renew a power meter service contract, or replace the power monitor. Since many power monitors need to be hardwired to an Ethernet connection, replacing the equipment might be problematic because the hospitals were hesitant to approve new wiring.

A new, wireless, cloud-based power monitor provided an alternative for Matthew Turner, a field service engineer with Kansas-based Marquis Medical.

Turner liked many of the features, particularly that the requirement to put in a requisition for an Ethernet line was eliminated. Turner's boss gave him the green light to try it.

A CT system has a lot of expensive and sensitive computer boards and electronics. Marquis Medical had experienced some intermittent power fluctuations and was losing parts as a result. Turner noticed that the

"The cloud access and the Mobile App were difference makers for Turner and Marquis Medical, allowing them to prove that continuous power was not provided."

hospital was having some power flickers, and he was onsite troubleshooting.

“I just kind of assumed that maybe we needed to check the incoming power because a system has to have a certain amount of steady power flow,” Turner says.

About a week after installing the Fluke 3540, the hospital took a huge power hit where the voltage went from the regular 280 volts per leg down to zero. The power came back on and went back off at least three times in a row.

As a result, the team ended up losing the generator box in the CT, which costs between $70,000 to $100,000 to replace. Because Marquis Medical is a full-service provider, it was responsible for the loss. However, its contract states that it must have uninterrupted power. Because of the power fluctuations, Turner knew that the system lost power, but could he prove that?

**The proof is in the power**

Using the Fluke Connect® Condition Monitoring software and Mobile App, part of the Fluke Accelix™ suite, Turner was able to prove that the power was interrupted.

Although some intermittent website issues occurred (which have been corrected) and Turner was unable to run a report using the software, he was able to take screenshots of the information with his smartphone. The cloud access and Mobile App were difference makers for Turner and Marquis Medical, allowing them to prove that continuous power was not provided.

Turner expressed that sometimes his email alerts for other monitors were delayed, making the push notifications of the Fluke Connect Mobile App a valuable option.

“Sometimes it may be hours, and then all of a sudden, you get 15 email alerts at once,” Turner says. “The Fluke Connect app actually alerts your cell phone. You can set it to alert it for any kind of power drop, any kind of current drop, and I like that about it.”

We learned about Matthew Turner’s story when he commented on a post on our Pilots of Change Facebook group. If you love technology and learning more about what’s possible, request to join this closed group.
